

# BMIQ:

**A beta-mixture quantile  
normalization method for  
correcting probe design bias  
in Illumina Infinium 450k  
DNA methylation data**

# DNA Methylation

- DNA methylation is an epigenetic modification affecting gene expression without altering the DNA sequence.

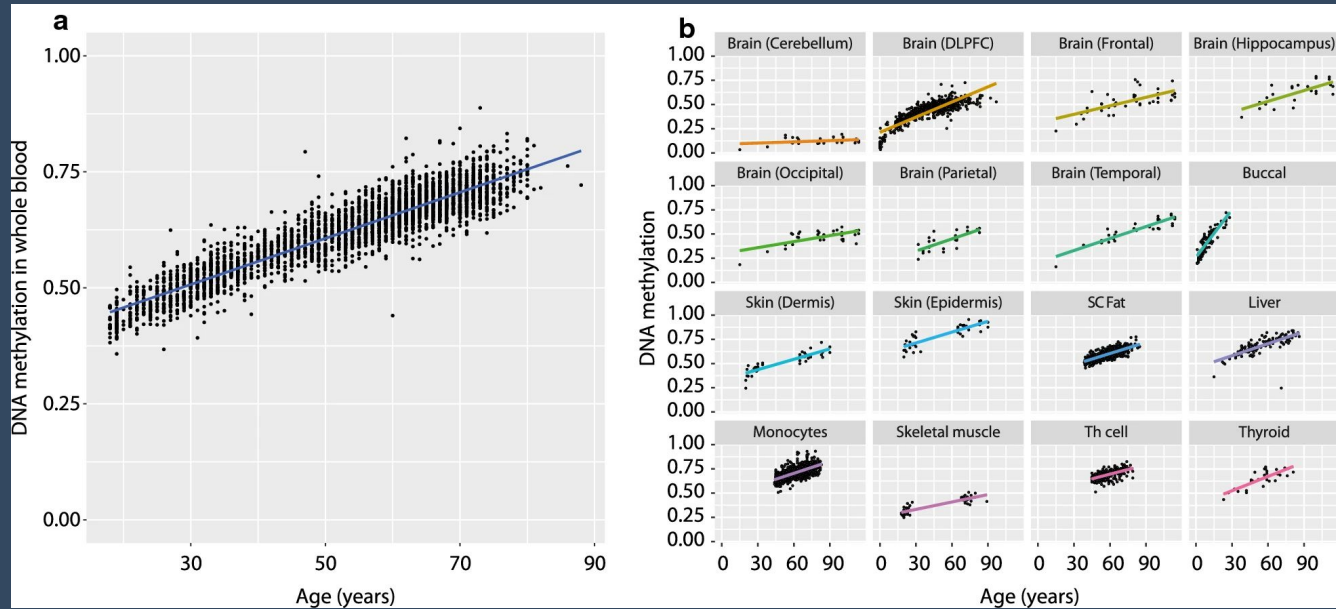

Wang et al, 2023

Smallwood et al, 2012

# Study DNA methylation is challenging

- DNA methylation is highly variable between cell types and developmental stages.
- Technical variability can introduce bias and noise to the biological differences.

**How to address  
this challenges?**

# With Normalization :)

## BMIQ

Beta Mixture Quantile normalization (BMIQ) is a method developed particularly for **Illumina methylation array data**.

## BMIQ Assumption

**Methylation level** distributions of **Type I** and **Type II probes** should be the **same** for the **same biological sample**.

# Illumina methylation arrays

Type I

Fluorescent signal

Type II

Colorimetric readout

## A. Infinium I

Unmethylated locus

Methylated locus

## B. Infinium II

Unmethylated locus

Methylated locus

Specificity  
Sensitivity

BMIQ  
adjustment

variance

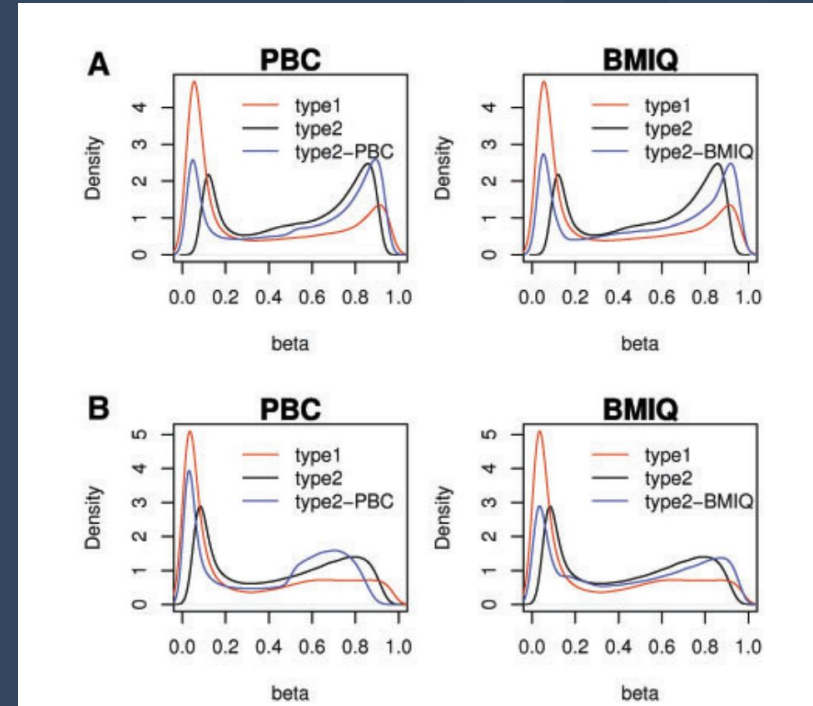

# BMIQ Key Steps

1 Data segregation and analysis

2 Distribution Modeling

3 Normalization Process

4 Evaluation and adjustment

# Where to find BMIQ

Multiple R packages integrate BMIQ normalization:

- waterMelon  
(<https://bioconductor.org/packages/waterMelon>)
- ChAMP  
(<https://bioconductor.org/packages/ChAMP>)
- Minfi  
(<https://bioconductor.org/packages/minfi>)
- ENmix  
(<https://bioconductor.org/packages/ENmix>)

# Thanks!
